External cooling of the rotor blades of turbines with
an air-water mixture makes it possible, in principle,
to ensure normal operating conditions at any tempera-
ture. The thermal stresses in the disc of the turbine
rotor wheel may also be reduced. Operating experi-
ence of steam turbines shows that substantial de-
struction of the inlet edges of blades, made from
readily available materials, is observed at a high de-
gree of steam wetness (more than 10 - 12%) during the
course of many thousands of hours of operation. With
a relative water consumption of 0.2 - 1% of the gas

A method of polarographic analysis is described that
may be generally used for determining the functional
group $>SO_2$. The presence of the $-SO_3H$ group does
not interfere with this determination.

SOLUBILITY OF GASES IN DIESEL FUEL AND IN
GAS OIL FROM CATALYTIC CRACKING, INVESTI-
GATED UNDER HIGH PRESSURES. [1960] 6p.
3 refs.

Order from LC or SLA mi\$1.80, ph\$1.80 61-10364

Trans. of Khim[iya] i Tekhnol[ogiya] Topliv [i Masel]
(USSR) 1960 [v. 5] no. 4, p. 5-7.

A determination of solubility for H₂, N₂, CO, CH₄,
and CO₂ gases in diesel fuel and in catalytic-cracking
gas oil under 3- to 40-atm pressure was made by
using the method of V. V. Plat'yev and M. I. Levina
(Khim. Tverdogo Topliva 8: 866, 1937; available in
translation from LC or SLA as 59-14126). The solu-
bility coefficient under pressure up to 15 kg/sq cm
shows no significant deviation from Henry's law even
for CO₂ and CH₄.
